

# RBE 550 W6\_Assignment 2

## ANA\* vs A\* Introduction:

In this assignment, we have implemented Anytime Nonparametric A\* algorithm and compared parameters like cost and time required to reach the goal node with the A\* algorithm.

## Pseudo Code:

### ANA\*:

```
ANA*()
15:  $G \leftarrow \infty$ ;  $E \leftarrow \infty$ ;  $OPEN \leftarrow \emptyset$ ;  $\forall s : g(s) \leftarrow \infty$ ;  $g(s_{start}) \leftarrow 0$ 
16: Insert  $s_{start}$  into  $OPEN$  with key  $e(s_{start})$ 
17: while  $OPEN \neq \emptyset$  do
18:   IMPROVESOLUTION()
19:   Report current  $E$ -suboptimal solution
20:   Update keys  $e(s)$  in  $OPEN$  and prune if  $g(s) + h(s) \geq G$ 

IMPROVESOLUTION()
1: while  $OPEN \neq \emptyset$  do
2:    $s \leftarrow \arg \max_{s \in OPEN} \{e(s)\}$ 
3:    $OPEN \leftarrow OPEN \setminus \{s\}$ 
4:   if  $e(s) < E$  then
5:      $E \leftarrow e(s)$ 
6:   if ISGOAL( $s$ ) then
7:      $G \leftarrow g(s)$ 
8:     return
9:   for each successor  $s'$  of  $s$  do
10:    if  $g(s) + c(s, s') < g(s')$  then
11:       $g(s') \leftarrow g(s) + c(s, s')$ 
12:       $pred(s') \leftarrow s$ 
13:      if  $g(s') + h(s') < G$  then
14:        Insert or update  $s'$  in  $OPEN$  with key  $e(s')$ 
```

### A\*:

```
A* search {
  closed list = [ ]
  open list = [start node]

  do {
    if open list is empty then {
      return no solution
    }
    n = heuristic best node
    if n == final node then {
      return path from start to goal node
    }
    foreach direct available node do {
      if current node not in open and not in closed list do {
        add current node to open list and calculate heuristic
        set n as his parent node
      }
      else {
        check if path from star node to current node is
        better;
        if it is better calculate heuristics and transfer
        current node from closed list to open list
        set n as his parent node
      }
    }
    delete n from open list
    add n to closed list
  } while (open list is not empty)
}
```

## Test Cases:

We have taken few test cases to compare the results of the ANA\* algorithm with A\*. The test cases are depicted with the original maps, and subsequently followed by the final results of both the algorithms. The test cases mentioned above are as follows:

- Trivial
- Medium
- Hard
- Very Hard

The difference between the above mentioned maps are their sizes. Increasing the size increases its complexity by many folds, and to test the robustness of ANA\* and A\*, we have implemented both the algorithms and obtained their output successfully.

### TRIVIAL

Original map:

ANA\* output:

ANA \* Performance Data:

('Run-Time: ', 2.7298927307128906, ' milliseconds')

('Iterations: ', 1)

('G cost: ', 146)

('E cost: ', 38192.182646962625)

A\* output:

A\* Performance Data :

('Run-Time: ', 2.758026123046875, 'milliseconds')

('Iterations: ', 1)

('G cost: ', 146)

---

## MEDIUM

Original map:

ANA\* output:

ANA\* Performance Data:

('Run-Time: ', 217.96703338623047, ' milliseconds')

('Iterations: ', 1)

('G cost: ', 3226)

('E cost: ', 4416.15913140638)

A\* output:

A\* Performance Data:  
(Run-Time: ', 0.032901763916015625, 'milliseconds')  
(Iterations: ', 2)  
(G cost: ', 3226)

---

HARD

Original map:

ANA\* output:

ANA\* Performance Data:

('Run-Time: ', 761.7208957672119, ' milliseconds')

('Iterations: ', 1)

('G cost: ', 8286)

('E cost: ', 2199.284195071731)

A\* output:

A\* Performance Data:

('Run-Time: ', 162.9171371459961, 'milliseconds')

('Iterations: ', 2)

('G cost: ', 8286)

---

VERY HARD

Original map:

ANA\* output:

ANA\* Performance Data:

('Run-Time: ', 4901.829957962036, ' milliseconds')

('Iterations: ', 1)

('G cost: ', 18062)

('E cost: ', 864.6482879223693)

A\* output:

A\* Performance Data:

('Run-Time: ', 776.1249542236328, 'milliseconds')

('Iterations: ', 2)

('G cost: ', 18062)

## Summary of performance:

Test cases	ANA*	A*
Trivial	<ul style="list-style-type: none"><li>• Run-Time: 2.729 ms</li><li>• Iterations: 1</li><li>• G cost: 146</li><li>• E cost: 38192.1826</li></ul>	<ul style="list-style-type: none"><li>• Run-Time: 2.758 ms</li><li>• Iterations: 1</li><li>• G cost: 146</li></ul>
Medium	<ul style="list-style-type: none"><li>• Run-Time: 217.967 ms</li><li>• Iterations: 1</li><li>• G cost: 3226</li><li>• E cost: 4416.1591</li></ul>	<ul style="list-style-type: none"><li>• Run-Time: 0.0329 ms</li><li>• Iterations: 2</li><li>• G cost: 3226</li></ul>
Hard	<ul style="list-style-type: none"><li>• Run-Time: 761.7208 ms</li><li>• Iterations: 1</li><li>• G cost: 8286</li><li>• E cost: 2199.2841</li></ul>	<ul style="list-style-type: none"><li>• Run-Time: 162.917 ms</li><li>• Iterations: 2</li><li>• G cost: 8286</li></ul>
Very Hard	<ul style="list-style-type: none"><li>• Run-Time: 4901.8299 ms</li><li>• Iterations: 1</li><li>• G cost: 18062</li><li>• E cost: 864.6482</li></ul>	<ul style="list-style-type: none"><li>• Run-Time: 776.1249 ms</li><li>• Iterations: 2</li><li>• G cost: 18062</li></ul>

## Conclusion:

We were able to successfully implement ANA\* and A\* and analyze its output. The major difference between A\* and ANA\* was that ANA\* calculates a maximal function  $e(s)$  which adaptively reduces to expand on the most promising node per iteration, and adapts to the greedy nature to improve its path quality. We found that ANA\* took longer to find an optimal solution for all of the test cases than the A\* search algorithm.
